

AIM:

Setup and configure a LAN (Local Area NETWORK) using a switch and ethernet cables in your lab.

What is LAN?

A Local Area Network refers to a network that connects device with limited area, such as an office building, school or home. It enables users to share resources, including data, printers and internet access. LAN connects devices to promote collaboration and transfer information between users such as computers, printers, servers and switches. Each device connected on a device on a LAN switch, can communicate directly on a each other, allowing for fast and secure transfer.

How to setup a LAN:

Step 1: Plan and design an appropriate network topology taking into account network requirement and equipment location.

Step 2: You can take 4 computers, a switch with 8, 16 or 24 ports which is sufficient for network of these and 4 ethernet cables.

Step 3: Connect your computers to network switch, via an ethernet cable which is simple as plugging one end of a ethernet cable into your computer and the other end into your network switch.

Step 4: Assign IP address to your PCs

1) log on to the client computer as administrator or as owner.

- 2) click network and internet connections.
- 3) Right click local area connection / Ethernet → go to properties → select Internet protocol (TCP / IPV4) → click on properties - select use the following ip addresses option and assign ip address.

Step 5: Configure a network switch

- 1) Connect your computer to the switch to access the switch's web interface, you will need to connect your computer to the switch using cable.
- 2) Log into the web interface: open a web browser and enter the ip address of the switch in the address bar. This should bring up the login page for the switch's web interface. Enter username and password to login.
- 3) Configure basic settings: once you're logged in you will be able to configure basic settings for the switch.
- 4) Assign IP address AS: 10.1.1.5, subnet mask 255.0.0.0.

Step 6: Check the connectivity between switch and other machine by using ping command in cmd by the device

Step 7: select a folder → go to properties → click sharing tab → share it with everyone on the same LAN.

step 8: Try to access the shared folder from other computers of the network

RESULT:

Thus the setup and configure of LAN is studied and observed.
